1
Introduction

WARNING

Please read entire manual before attempting any installation or set up of this machine. Failure to do so may result in personal injury or machine damage.

The door interlock switch located inside the control panel does not remove power from the entire control panel. This switch only disables I/O control power, therefore use extreme caution when door is open.

410 SERVO DRIVE RECIPROCATOR

WARRANTY

For a period of six (6) months from the date of shipment or prior to the first 250,000 cycles, RIMROCK Corporation will repair or replace, at it's option, any part of the system that is found to be defective in workmanship or material. Determination of our obligation under this warranty will be made by RIMROCK after examination of alleged defective materials are returned to us transportation prepaid.

The foregoing warranty is exclusive, and in lieu of all other warranties, whether written, oral, or implied, including the warranty of merchantability and the warranty of fitness for a particular purpose.

Any alteration, modification or repair to any circuit board contained in the system will **VOID** all warranties. All electronic repairs **MUST** be handled through RIMROCK Corporation.

1. INTRODUCTION

1.1 GENERAL EQUIPMENT SAFETY

The invention of automatic equipment used on die casting machines greatly enhanced the production and efficiency of making quality castings. Like any other machinery, if not used safely it can pose a hazard to personnel as well as damage to the equipment.

Safety of operation begins with training personnel in the safe operation and maintenance of this equipment. Operator and maintenance people must understand how the equipment works in order to operate it safely. The owner/end user of this equipment is responsible for the training to safely operate and maintain this equipment. RIMROCK will provide equipment training when requested.

Machine owners, operators, maintenance and service personnel must be aware of the fact that every day common safety practices are vital part of their job and must be compiled with constantly. Use of personnel protective equipment and keeping the work area clean and free of potential hazards will enhance any safety program. In addition, all warning labels, signs and guards must always be replaced if they are removed for any reason. Safety violations should always be reported to the proper personnel.

Always remember automatic equipment starts by a signal and gives you no warning. Always be aware of this and make sure the equipment is shut off and all power sources locked out before you work on or around the equipment.

In addition to the safety precautions in the manual, all the latest OSHA Instructions, Local, Federal and National Safety Codes and Safety Rules must be understood and followed to operate equipment safely. For additions safety information on die casting, refer to NADCA's Die Casting Safety Manual E-908.

1.2 INSTALLATION SAFETY

Study the equipment's manual before attempting to install this machine. The installation must be made with only qualified personnel capable of positioning, anchoring, making power connections and interlocking this equipment with other equipment. Failure to use qualified personnel could result in personnel injury as well as damage to your equipment. The electrical connections must be made by a qualified electrician who must be able to read and understand electrical schematics in order to assure a safe hook-up. Correct grounding of interlock connections are explained and illustrated in your manual. In addition, a safety barrier must be installed to prevent personnel from entering the path of moving equipment while it is operating. It should also be noted that proper clearance must be allowed for all movements of your equipment. By following these recommended steps your equipment should operate safely and correctly.

1.3 SET-UP AND OPERATION SAFETY

Operator and maintenance personnel must read the equipment manual and be trained in the proper operation of this equipment in order to set-up ant operate it safely. Always make sure all control panel switches are "off" when power is first applied. Never make any adjustments to the equipment while it is operating. Remember, the machine has the ability to strike you, pinch or grab loose clothing which may result in injury to you. In order to stay out of its path, you must always know in which direction the machine is going to move next. It should never be necessary to make adjustments to this equipment with the power "ON". If you find it necessary to make an adjustment or for troubleshooting with the power "ON", a second qualified person should be at the operator panel operating the equipment in "MANUAL" mode. The second person should always have sight of the person working on the equipment. Under NO circumstances would any adjustments be made while the equipment is moving. Never operate the equipment before making sure the area is clear and all safety guards and devices are in place. Only authorized personnel should modify the programming of this equipment and it can never be operated without the

recommended interlocks. Any unsafe conditions of equipment operation should be reported to the proper personnel immediately.

1.4 MAINTENANCE SAFETY

Do not attempt to perform any maintenance on this equipment until you read and understand all the safety instructions and all the power sources are locked out according to OSHA's Lock Out Procedures. Be sure the electrical power in the interlock system is "OFF" when the machines power is disconnected. these are usually yellow wires and can supply power from another source when the main disconnect is off. Always turn power "OFF" before removing the circuit boards to prevent damage to the boards and also "Electrical Shock" to yourself. Keeping your equipment clean and the area in which it is located clean is a vital part of your safety program. Developing a set periodic maintenance program of your own, plus following recommended maintenance in this manual will extend your equipment's life and make it safer to operate. Do not attempt to alter, bypass or short circuit any safety device or systems on this equipment. All guards, shields, barriers or covers must be put back after any maintenance is performed or repairs are completed before the equipment is returned to service. The end user of this equipment is responsible for the safe operation of the equipment and for the safety of their plant operations and maintenance personnel.

1.5 MACHINE DESCRIPTION

The RIMROCK Model 410 Reciprocator is a fully programmable die spray system, using one motor for the power source. This motor drives a face mounted gear reducer that is directly coupled to the main drive shaft. The main drive shaft is attached to the Multi- Link arm which holds the spray manifold.

The motor is controlled with a newly developed computer control system. This computer system allows complete control of the reciprocator. Each movement of the machine has a wide range of programmable positions, dwell times and spray functions. All positions are programmed from the control panel allowing for easy and fast adjustments.

The control system is mounted in one control cabinet. The system consists of: keypad, cards, card cage, motor controller, input/output rack, power supply, message center and relays.

THE COMPUTER SYSTEM CONSISTS OF THE FOLLOWING:

Keypad - Mounted on the front of the operators panel, it is used to program the system and show digital readouts of all programmable functions of the unit. It communicates to the CPU card via a serial communication network. This allows the Keypad to be located away from the main control box.

Video Keypad - As an option this machine is available with a Video Touch Screen Operator Interface, for use as a Keypad. This Video Interface utilizes a Capacitive Touch Screen on front of a Color LCD Flat Panel Display. All RIMROCK Machines in a cell can be controlled by this one interface. All functions are similar to utilizing a Standard Keypad. The only exceptions are in the teach area, where this device makes programming easier.

Card Cage - Uses a STD bus system for communication between the various cards.

Servo Card - This card reads the output of the encoder mounted on the motor, and feeds the speed signals to the servo drive. The encoder allows constant tracking of the machine's movement.

Central Processing Unit (CPU) - The CPU Card is the brain of the entire system. It handles all information to and from the other cards. This card also contains plug in chips (FLASH EPROM), which contains the system software, (Software is a computer program that tells the system how to work). The software has been electronically written into the EPROM. The information written to the EPROM is retained whether power is applied or not. It does not require battery back up to retain it's program. The CPU card houses a set of self contained

battery backed RAM chips that are the storage chips for the operating parameters (the settings that the customer programs in for his operation). It has serial communications that allow it to communicate to the Keypad and the Message center. It also has Digital I/O that connects the computer to the I/O rack. Which sends and receives signals from the input/output modules mounted on the I/O rack.

Input / Output Rack - This card-like rack contains modules that connect the computer to the outside world. All signals to and from the die cast machine and reciprocator are connected to plug in modules which interface computer signals to the die cast machine and the reciprocator.

Power Supply - The supply is the 5-24-12 VDC regulated supply for the computer and for the key pad. The 24 volt DC supply feeds the reciprocator limit switches and interlock circuits.

Message Center - The 410 features a microprocessor based message center that communicates with the system CPU via a serial link. This message center is designed to make the users job easier and faster which increases productivity. Diagnostics, cycle and programming messages result in decreased set-up time, faster troubleshooting and even simpler programming. In the event of a fault, the fault number, as well as, an explanation message is displayed by the message center.

Multiple Lube Option - The 410 Reciprocator is available with multiple lube capability. The one lube is standard and multiple lubes is a customer option. When the system is used with multiple LUBES the other lubes are called LUBE B, & LUBE C. If the second lube is used, the spray program will use LUBE B DWELL-SET TIME and LUBE B SWEEP-SET TIME for it's spray functions. If a third lube is used, the spray program will use the auxiliary keys to program it's spray functions. The outputs for the spray functions are described in the SPRAY FUNCTION section of this manual.

Horizontal Drive - The reciprocator has a horizontal drive assembly, either powered or manual. This drive will move the reciprocator parallel to the center line of the die cast machine. The manual unit uses a adapter tool that mounts on the horizontal drive screw at the rear of the unit. A ¾" wrench should be used to turn the tool which will move the machine. If the powered drive (a customer option) is selected, a motor that drives the drive screw is mounted on the rear of the reciprocator. It is controlled by a three position selector switch which is mounted in the main control panel.

1.6 UNPACKING INSTRUCTIONS

After removing top and sides of shipping crate, remove the spray package and control panel. Note the interconnecting cable is permanently attached to the reciprocator and should not be removed. Care must be taken when handling the reciprocator and cable assembly. Remove the mounting bolts that secure the reciprocator during shipping. Remove the covers to expose the lifting lugs. Using a crane of the appropriate size, the machine weighs approximately 500 pounds (700 pounds for 80" version), place the hook in the lifting lugs on top of the reciprocator and lift it out of the crate.

1.7 MODES OF OPERATION

There are two modes of operation available on the Servo Drive Reciprocator. The Reciprocator can only be in one mode of operation at a time. These two modes are:

MANUAL with MANUAL TEACH

AUTOMATIC with AUTO TEACH

The mode of operation is selected by pressing either MANUAL or AUTO keys located on the keypad (SEE KEYPAD DRAWING IN SECTION 3).

MANUAL MODE:

This mode of operation allows the operator to run the Reciprocator in a jog mode to determine the correct position settings for AUTO CYCLE with the die cast machine. In this mode of operation the Die Cast Machine Clear interlock must be present to extend the arm forward and into the die. Manual teach is also available in this mode.

AUTOMATIC MODE:

After the correct settings are found and input from the MANUAL mode, the Reciprocator is now ready to operate with the die cast machine in full AUTO CYCLE. Auto teach is available in this mode.

1.8 KEYPAD SECTIONS

PANEL DISPLAY:

The graphic display on the KEYPAD shows the position and status of the Reciprocator in all modes and all settings at all times. This graphic display give the operator a convenient means of checking the status of the Reciprocator, even if the Reciprocator is not currently visible. This display contains the following readouts:

DISPLAY SECTIONS:

Each section contains a LED numeric display, a set key and a LED indicator. Each LED will light up when the Reciprocator is in that particular function and the LED numeric display will show the current setting of that function.

PLEASE REFER TO SECTION 3 FOR PROGRAMMING INSTRUCTIONS

1.9 SEQUENCE OF OPERATION

The Reciprocator begins and ends each cycle at the REST position. Unless the short cycle option is activated the rest position is with the spray arm completely retracted. Upon receiving a RECIPROCATOR APPROACH signal from the Die Cast Machine, the Reciprocator will move to the Approach position. It will remain there until it receives the RECIPROCATOR START interlock form the Die Cast Machine. At this time it will cycle through the program steps that are programmed into the current memory area. Upon completion of the programmed cycle the Reciprocator will return to the Rest position and give the CYCLE COMPLETE interlock output.

1.10 MACHINE POSITIONS

The following positions, shown on the keypad Machine Status area, are the positions of the Reciprocator. The LED's on this diagram shows the current position of the Reciprocator.

REST:

This position is the point where the Spray Arm is at its fully retracted position. At this point the Rest Position Proximity Switch is actuated. This point is used as the zero point for the encoder. The REST LED will stay on as long as the arm is in this position. If Short Cycle is selected the Rest Position is still with the arm fully retracted.

APPROACH POSITION:

This is a programmable position that the arm will move to when the Reciprocator Approach interlock is received. It is also the position that the Spray Arm will stop at in cycle when the Short Cycle option is activated.

IN DIE:

This led is activated any time the Reciprocator is extended past the Approach Position, and indicates the Spray Arm is in the die area.

2
Installation

2. INSTALLATION

2.1 MOUNTING THE RECIPROCATOR

Mount the reciprocator on top of the stationary platen of the die cast machine on a flat surface. Side to side location can be found by centering the reciprocator spray manifold on the center line of the die cast machine. Proper end to end positioning of the reciprocator will place the arm so it is centered in the die spray area. The mounting blocks should be positioned in the center of their adjustment on the side plate. This will allow the reciprocator to be adjusted 5 ¼ inches each direction. At this time you can use the crane to set the reciprocator on top of the machine, positioning it as explained above.

Once the reciprocator is positioned correctly, mark the mounting bolt holes. Now remove the reciprocator from the platen and drill the proper size holes for the mounting hardware (the holes in the mount plate have clearance for ½" bolts). The last step is to re-position the reciprocator on the platen and bolt it down.

NOTE: A spacer might be required under the reciprocator if the spray nozzle assembly is to clear the top of the platen on the die cast machine.This will depend on the manifold configuration and how you mount the Reciprocator to the Die Cast Machine.

2.2 PROXIMITY SWITCH ADJUSTMENTS

Proximity switches are used on the Reciprocator to indicate physical positions of the arm. These Proximity switches are mounted inside the body of the Reciprocator, refer to mechanical assembly drawings for location of proximity switches.

2.2.1 REST POSITION PROXIMITY SWITCH:

(701-PS)

When this proximity switch is tripped the REST POSITION LED on the control panel lights and the Input #12 is activated. In this position the arm is fully retracted and the REST POSITION proximity switch (701-PS) will be tripped. This is the only position of the arm that will allow the Auto Mode to be entered. This proximity switch is not adjustable.

It is also used to signal the servo drive card that the arm has reached the full retracted position (fully CCW motor rotation). If this switch is tripped at an in-appropriate time a Following Error will be generated.

To access this proximity switch, remove the side cover's on the machine. There are four proximity switches located under the cover's in the same area. The rest position proximity switch is the bottom one. The rest position proximity switch is factory set and can not be adjustment in the field. This proximity switch is used to home the machine after power is applied to the control panel (see Homing Procedure).

2.2.2 CHECK POSITION:

(702-PS)

This position is used by the computer to check the arm position during an Auto cycle. It uses a factory set proximity switch (702-PS) that activates Input #13. The function of the Check Position is to insure the spray manifold is repeating the same spray positions from cycle to cycle.

If it is necessary to reset this position (and not the proximity switch) see AUX 3 key explanation in this manual.

Aux 3 Section 3 Page 4

To access this proximity switch, remove the cover's from the machine. There are four proximity switches located under the cover's in the same area. The check position proximity is in the second one up from the bottom. This switch is factory set and is not adjustable in the field.

2.2.3 RECIPROCATOR CLEAR:

(703-PS)

This proximity switch is used to signal the Die Cast Machine that the Reciprocator is clear of the die area and any core pull cylinders. It is set

by the customer to actuate at the appropriate position. Care must be taken not to set it so that the die could hit the spray arm as it closes. If Short Cycle is activated (see section 3) this proximity switch must be set to allow it to trip when the arm stops at the Approach Position.

To access this proximity switch, remove the side cover's on the machine. There are four proximity switches located between the side plates in the same area. The reciprocator clear proximity switch is the closest to the top of this cluster of switches. This switch is adjustable and must be set by the customer.

There are three sets of contacts that trip at the same time to be used at the customer's convenience. This proximity switch should be adjusted so it trips when the reciprocator is clear of the dies and core pull cylinders so the dies will close without interfering with the reciprocator.

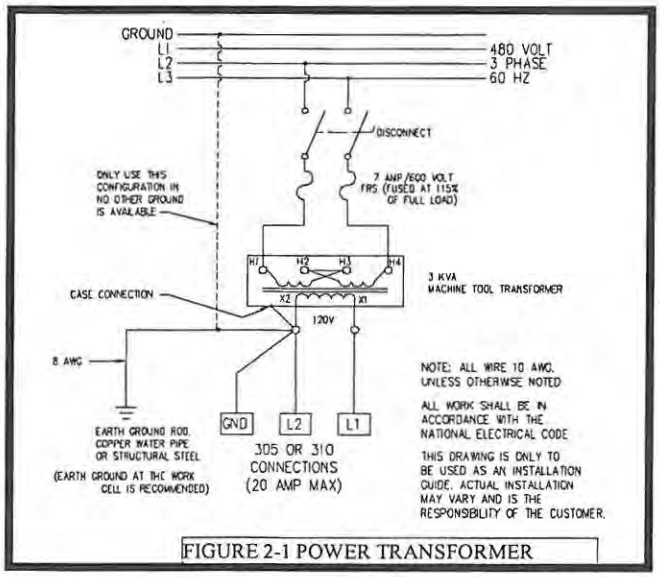

FIGURE 2-1 POWER TRANSFORMER

2.2.4 CLOCK WISE PROXIMITY SWITCH

(706-PS)

This proximity switch is used by the servo control system , and alerts the computer system when ever it is tripped. It is factory set at the extreme end of the forward travel of the 410 SDR.

If this switch is tripped at an in-appropriate time a Following Error will be generated

2.3 ELECTRICAL

Requirements 47, 60, 72": 120 VAC, 15 amp, 1 phase with ground; conduit with interlock wires and 3 power wires. Refer to electrical drawings for a guide to the electrical installation.

Requirements 80": 120 VAC, 5 amp, 1 phase with ground, 220 VAC, 15 amp, 1 phase with ground; conduit with interlock wires and power wires. Refer to electrical drawings for a guide to the electrical installation.

All interconnections are made on the connector supplied at the bottom of the control cabinet or on panel mounted terminals in the control cabinet. This machine may come equipped with quick disconnects on the right hand side of the control box. The second connection position from the top is where the machine wiring connections are made and consist of the motor, encoder wires and limit switch wires. The other end of this conduit is connected to Reciprocator .

The lower connector is used for interlocking connections. Power connections are connected inside the control box on a terminal strip.

Connect the power as follows:

120 VAC to 7L1 (Circuit Breaker)

Neutral to 7L2

Ground to GND

As with all computers, a proper ground connection is required. To check the power, read the voltage between 7L1 and 7L2, the voltage should be 120 VAC. The voltage between 7L2 and GND should not exceed 1.0 VAC at any time during the cycle. Refer to Figures 2-1 and 2-2 for a power connection guideline.

We strongly suggest using a dedicated 3.0 KVA machine tool transformer as a power source for the Reciprocator. Do not use a general purpose transformer because it will not regulate the current, causing the voltage to vary when the transformer is near its saturation point. See Figure 2-1 for 410-47, 60, 72 inch transformer connection recommendations, and electrical box

assembly drawings for transformer connection for the 410-80 inch. A non-dedicated transformer may cause noise and/or spikes on the Reciprocator power line which will cause various computer related problems while cycling.

Note to PLC user:

All the interlocks required are dry contacts, since a dry contact draws very little current, triac type outputs may not shut off. This is due to the nature of a triac, which requires a minimum of current draw to shut off completely.

To prevent this type of problem it is suggested that either a load resistor be tied across the output or an interface relay be driven by the PLC output. Some PLC manufacturers have already taken care of this problem by including an isolated interface for each I/O contact within the PLC - be aware of which type you have.

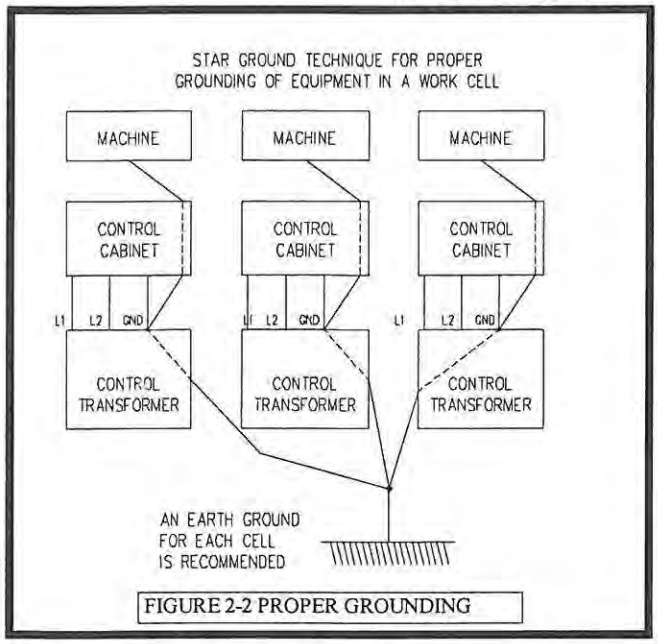

FIGURE 2-2 PROPER GROUNDING

2.4 INTERLOCKING *

Referencing Electrical drawings.

The following input interlocks are designed for the safe operation of the Reciprocator and should be used in all cases, not defeated or jumped out.

All connections for interlocks are located on the right hand side of the control box in the lower quick disconnect fitting or on panel mounted terminals in the control cabinet. All contacts must be 120 VAC dry contacts, meaning that there will be no electrical link between the D.C.M. and the reciprocator (isolated with relays). The interlock LED's on the keypad show whether or not the interlocks are present.

2.4.1 INPUTS*

RECIPROCATOR START: (SLOT # 10)

Wire #'s 703 & 707 N/O contacts are activated (closed) when the reciprocator is to start its cycle. Run this from the PART SENSED signal if an extractor is used, from an operator push button or from a door switch.

DIE START OPEN: (SLOT #9)

Wire #'s 703 & 708 N/O contacts are activated (closed) on die start open, deactivated (opened) on die full open. This contact signals the reciprocator to move to the Approach Position. (Recip. Approach)

DIES FULL OPEN: (SLOT #8)

Wire #'s 703 & 709 N/O contacts are activated (closed) when dies are full open. (O.K. to Extend)

DIE LOCKED: (SLOT #11)

Wire #'s 703 & 710 N/O contacts are activated (closed) when dies are locked up, deactivated (opened) on die unlock. (Recip. Reset)

EXTERNAL SAFETY:

Can be used with contacts from safety gates, mats, beams, etc. and connected across wires 701 and 702. If this connection is not closed (I.E. safety violated) there will be no power to the Interlocks and motor controls, but there will

be 120 VAC Present at the 24 and 5 volt power supplies. To restore power the safety must be made and the manual on key must be pressed. This interlock is used to provide a method of stopping the movement of the Reciprocator by turning off the Servo motor controller.

Note: This interlock has the same effect as opening the control box door and can also be used as a remote shutdown.

CONTINUE FROM WAIT #1: (SLOT #15)

Wire No. 703 and 749 N/O contacts are activated (closed) when the reciprocator is to continue from the programmed wait #1 function. See Section 3 for programming of the wait #1 function. This wait function is typically used for the movement of hydraulic die core slides during an automatic spray cycle.

CONTINUE FROM WAIT #2: (SLOT #22)

Wire No. 703 and 750 N/O contacts are activated (closed) when the reciprocator is to continue from the programmed wait #2 function. See Section 3 for programming of the wait #2 function. This wait function is typically used for the movement of hydraulic die core slides during an automatic spray cycle.

DCM IN AUTO: (SLOT #23)

* This is only a recommendation and is in no way the only way to interface a Reciprocator with a die cast machine. RIMROCK accepts no liability for actual interlocking of our equipment with the die cast machine. Wire No. 703 and 762 N/O contacts are activated (closed) when the DCM is in AUTO mode. If properly programmed, absence of this signal will prevent the reciprocator from going to AUTO mode. The loss of this signal while the reciprocator is in AUTO will result in a 9.03 fault. See Section 3 for programming of check DCM in AUTO (Aux 4.7).

2.4.2 OUTPUTS*

CYCLE COMPLETE: (SLOT #1)

Wire #'s 714 & 715 N/O contacts are closed when spray cycle is complete. This contact is a momentary contact, released when the reciprocator receives the reset interlock (die locked).

RECIPROCATOR CLEAR:

Wire #'s 736 & 737 and 738 & 739 and 741 & 742 are N/O contacts that close when the reciprocator is clear of any interference with the die cast machine. These contacts are for machine interlocking. These contacts are directly controlled by PS-703. (See Section 2 & 3 - Arm Positions for more information.)

RECIPROCATOR IN AUTO: (SLOT #16)

Wire No. 743 and 744 are N/O contacts that close when the reciprocator is in AUTO mode.Wiring can be done by customers to their specifications. This output can signal the die cast machine or turn on a light, etc.

RECIPROCATOR WAIT #1: (SLOT #7)

Wire No. 747 and 748 are N/O contacts that close when the reciprocator is programmed into a wait state. The contact is maintained closed until the Continue from Wait #1 Input is activated. See Section 3 for programming of the Wait #1 function. This wait function is typically used for the movement of hydraulic die core slides during an automatic spray cycle.

RECIPROCATOR WAIT #2: (SLOT #21)

Wire No. 759 and 760 are N/O contacts that close when the reciprocator is programmed into a wait state. The contact is maintained closed until the Continue from Wait #2 Input is activated. See Section 3 for programming of the Wait #2 function. This wait function is typically used for the movement of hydraulic die core slides during an automatic spray cycle.

RECIPROCATOR FAULTED: (SLOT 17)

Wire No. 745 and 746 are N/O contacts that close if the reciprocator has a fault condition occur. Wiring can be done by customers to their specifications. This output can signal the die cast machine or turn on a light, etc.

* This is only a recommendation and is in no way the only way to interface a Reciprocator with a die cast machine. RIMROCK accepts no liability for actual interlocking of our equipment with the die cast machine.

2.5 PLUMBING CONNECTIONS:

SPRAY BLOW: Spray on a one lube unit has (4) hoses:

1. Pilot Air ------
2. Spray Air ---------->For lube (lube A) spray

3. Lube ----------

4. Blow ----------> For blow air

A two lube system will have (3) additional hoses:

1. Pilot Air -------

2. Spray Air ----------> For lube (lube B) spray

3. Lube ----------

A three lube system will have (3) additional hoses:

1. Pilot Air -------

2. Spray Air ----------> For lube (lube C) spray

3. Lube ----------

2.6 DRY CYCLING:

This machine may be dry cycled by insuring that the Die Cast Machine clear input is active and giving a cycle start input.

2.7 HOMING SEQUENCE:

With the machine in the manual mode, up to two LED's could be flashing, depending on where the machine was positioned when the machine was turned off. The MANUAL LED will be flashing and possibly the AUX 5 LED. If both are flashing, home the machine by pressing the AUX 5 key. If the AUX 5 LED is not flashing, the arm must be retracted to the Rest Position (using the retract key). The AUX 5 LED should now be flashing. If so pressing the AUX 5 key will automatically home the machine. When the machine homes it is finding the "0" position for the arm. Pressing the manual key during homing will stop the homing process.

2.8 MACHINE SIZE SETUP

The machine is shipped with the default settings as explained in Section 3 of this manual. You will have to program settings that will work for your application. Remember to select the correct machine size before starting programming.

3
Programming

3. Lube ----------

4. Blow ----------> For blow air

A two lube system will have (3) additional hoses:

1. Pilot Air -------

2. Spray Air ----------> For lube (lube B) spray

3. Lube ----------

A three lube system will have (3) additional hoses:

1. Pilot Air -------

2. Spray Air ----------> For lube (lube C) spray

3. Lube ----------

2.6 DRY CYCLING:

This machine may be dry cycled by insuring that the Die Cast Machine clear input is active and giving a cycle start input.

2.7 HOMING SEQUENCE:

With the machine in the manual mode, up to two LED's could be flashing, depending on where the machine was positioned when the machine was turned off. The MANUAL LED will be flashing and possibly the AUX 5 LED. If both are flashing, home the machine by pressing the AUX 5 key. If the AUX 5 LED is not flashing, the arm must be retracted to the Rest Position (using the retract key). The AUX 5 LED should now be flashing. If so pressing the AUX 5 key will automatically home the machine. When the machine homes it is finding the "0" position for the arm. Pressing the manual key during homing will stop the homing process.

2.8 MACHINE SIZE SETUP

The machine is shipped with the default settings as explained in Section 3 of this manual. You will have to program settings that will work for your application. Remember to select the correct machine size before starting programming.

3. PROGRAMMING

All initial programming must be done in the manual mode. Programming in auto mode is used for fine tuning and will be discussed in the next section.

3.1 GENERAL ALGORITHM

In general, any time a parameter needs to be changed, the sequence of keystrokes is:

1. While in manual mode, press the TEACH key, causing the teach LED to flash.

2. Enter into any of the five sections containing the parameter that needs to be changed by pressing one of the four SET keys or AUX keys.

3. Press the same SET key, or AUX key until the LED next to the parameter to be changed lights up. The present values in memory appear in the window as the parameters are scrolled through.

4. If in the timers or speeds section, enter in the new value with the numeric portion of the keypad. If in the arm position or dipper position section, jog the arm or dipper to the desired position or enter it numerically.

5. Finally, to enter the value into memory, press the ENTER key. When the new value is accepted the TEACH LED will once again start flashing.

Note: If a number punched in with the numerical portion of the keypad is incorrect, it may be cleared from the display with the CLEAR key. This is only effective if the ENTER key has not yet been pressed. Also, if a value is out of the acceptable range for the parameter, the displayed value will flash until the clear key is pressed.

If further parameters need to be changed, follow steps 2) through 5) again.

To exit the teach mode press the TEACH key again. The TEACH LED must be flashing in order to exit teach mode. If the LED is not flashing then the ENTER or CLEAR key must be pressed first to get the TEACH LED back to its flashing condition. Also, the teach mode will be exited if no key is pressed for 60 seconds; this is the "hands-off" feature of the Reciprocator. If in AUTO TEACH the manual key can be used to terminate teach and auto mode.

3.2 TYPICAL RECIPROCATOR CYCLE:

In a typical 410 cycle the reciprocator will be waiting at the Rest Position as the die cast machine dwells. As soon as the dies start to open (Reciprocator Approach Interlock) the arm will move to the Approach Position. When the dies are full open (O.K. to Extend) and the part is clear of the dies (Reciprocator Start), either manually or by an extractor, the 410 will start its spray cycle. The 410 Reciprocator can spray many different combinations of spray cycles. Below is a standard Sweep & Spray, Stop & Spray cycle. This is the same cycle used as an example in the Programming Section.

1. Move to a position above the parting line.
2. Move down to position 1, turn on the Lube and Dwell for 1.0 sec. (Stop and Spray)
3. Sweep down to position 2 at 35% full speed with Lube on. (Sweep & Spray)
4. Dwell at position 2 for 1.0 sec. with Lube on. (Stop & Spray)
5. Sweep down to position 3 at 15% full speed with Lube on. (Sweep & Spray)
6. Dwell at position 3 for 1.0 sec. with Lube on. (Stop & Spray)
7. Sweep down to position 4 at 45% with Lube on. (Sweep & Spray)
8. Dwell at position 4 for 1.0 sec. with Lube on. (Stop & Spray)
9. Sweep up to position 5 at 45% full speed with Air and Lube on. (Sweep & Spray)

10. Sweep up to position 6 at 45% full speed with Lube on. (Sweep & Spray)

11. Sweep up to position 7 at 25% full speed with Air on, turn off air at position 7 and continue out of die space. (Sweep & Blow)

After the 410 reaches position 7 it will stop all air blow (after Dwell if used) and move out of the die at the Fast Speed until it reaches its deceleration position. At this time it will give the Cycle Complete signal and continue to move to the Rest Position. When the Rest Position is reached the Reciprocator Fully Retracted proximity switch is made, allowing the dies to close.

One variation of this would be to have the Short Cycle ON. If this is the case then the arm will move from Position 7 at the Fast Speed until it reaches the Approach Position. Then the Cycle Complete signal will be given and the Reciprocator Clear proximity switch will be made, allowing the dies to close. However, the 410 will stay at this position until the next cycle is started.

3.3 KEYPAD DESCRIPTION

Note: Machines that utilize video operator stations do not have LED's as listed below.

RECIP STOP PUSH BUTTON (MAINTAINED):

A maintained red mushroom head push button is located on the operators panel. De-pressing this push button puts the reciprocator in a standby mode. It does this by interrupting power to the main control relay. This removes all power from the motor control circuit. However it does not remove power from all components in the control box. Provisions have been made for daisy chaining more maintained stop push buttons in series with this switch. This can be done per your requirements.

MANUAL/ON Key With LED:

When the MANUAL/ON key is pressed, the machine enters a jog type mode. The LED stays on (steady) until the AUTO or RECIP STOP key is pressed. If the machine needs to be homed, the manual LED will flash until the unit is homed. Homing the machine is done when the rest position proximity switch is activated and when AUX 5 key is pressed. For a complete description of the homing sequence, see Homing Sequence Section 2. Interlock LED's, and Machine Status LED's are active. All machine interlocks are considered when manually moving machine (i.e.: OK to Extend must be present for the arm to enter the die area). This key activates the control system (turn it on).

NOTE: The yellow push button on the right hand side of the keypad labeled ON duplicates this key.

AUTO Key With LED:

When the AUTO key is pressed the machine enters a fully automatic mode. The LED stays on (steady) until MANUAL is pressed. To enter the Auto mode the reciprocator arm must be at the rest position.

NOTE: The green push button on the right hand side of the keypad labeled AUTO duplicates this key.

AUTO CYCLE START Key With LED:

When in AUTO mode pressing this key starts a fully automatic cycle. The LED stays on (steady) until this cycle is completed or MANUAL is pressed. If a cycle start signal is present from the die cast machine or the system is in Auto Teach this key will not start a cycle.

NOTE: The green push button on the right hand side of the keypad labeled AUTO CYCLE START duplicates this key.

TEACH Key With LED:

When the teach key is pressed, the machine enters a set-up mode. The LED flashes until a set key is pressed, the teach key is pressed again or 10 seconds elapses. If in Manual cycle, Teach mode terminates when the TEACH key is pressed while the teach LED is flashing or after the 10 second "HANDS OFF" feature times out, the flashing of the TEACH LED indicates a section set key can now be pressed to change or review the values in that section. When the TEACH LED is on steady, this indicates a set function has been entered and is waiting for a new value to be entered, or is ready to review an

old value. This key will be used to set-up, change, or review the machine parameters. The changing of parameters through this key will be permitted during Manual Mode (manual teach) using the operation keys or the numeric key pad and during the Auto Mode (auto teach) using the arrow keys.

POSITION SET Key:

When in the teach mode, pressing the position set key enables the spray positions to be reviewed. With further pressing of the position set key, each position will be sequenced through and its value displayed. Any position may be changed by using the numeric key pad, or, if in Manual Teach, moving the machine by using the operation key to the position desired and pressing the ENTER key. When an operation key is pressed and released, the display will show the position of the arm.

ENTER Key:

This key is used to enter a new parameter into memory. The current value displayed will be entered replacing the old value. If the value is invalid for that parameter the display will flash until the CLEAR key is pressed or 10 seconds elapses.

CLEAR Key:

This key is used to clear an entry before the enter key is pressed, or to exit a section if no values have been changed, without leaving the Teach Mode. This key will never destroy original data. Pressing this key before a parameter has been modified will start the teach LED flashing, allowing you to exit the Teach Mode.

AUXILIARY Keys (keypad version):

When the AUXILIARY key is pressed (AUX 1, AUX 2, AUX 3, AUX 4, OR AUX 5) the number of the parameter to be changed will be shown in the numeric display next to the SPEED SET key and the associated parameter data will be shown in the numeric display next to the TIMER SET key. Each time the AUXILIARY key is pressed the next parameter will be displayed.

AUX 1: The 410 Reciprocator does not use the AUX 1 parameters.

AUX 2: This auxiliary key has 3 parameters and is used to set all auxiliary times. The AUX 2 Parameters are:

1. Lube Purge A timer. After the spray cycle is complete the purge timer is activated, this cleans the spray nozzles of excess lube. The purge function leaves the spray air "A" solenoids activated for the purge time. The spray air solenoid is output number 6 and uses wire numbers 718 & 7L2. The range is 0 to 99.9.

2. Lube Purge B timer. After the spray cycle is complete the purge timer is activated, this cleans the spray nozzles of excess lube. The purge function leaves the spray air "B" solenoids activated for the purge time. The spray air solenoid is output number 5 and uses wire numbers 719 & 7L2. The range is 0 to 99.9.

3. Lube Purge C timer. After the spray cycle is complete the purge timer is activated, this cleans the spray nozzles of excess lube. The purge function leaves the spray air "C" solenoids activated for the purge time. The spray air solenoid is output number 19 and uses wire numbers 722 & 7L2. The range is 0 to 99.9.

AUX 3: This auxiliary key has 5 parameters and is use to set all auxiliary positions. The AUX 3 Parameters are:

1. Check Position. This key is used to set the check position. While in the MANUAL TEACH mode and with the arm fully retracted the AUX 3 key may be pressed. At this time the AUX 3 LED will be on. Press the ARM EXTEND key, at this time the arm will begin to extend until it reaches the CHECK POSITION proximity switch. When the arm reaches the CHECK POSITION proximity switch release the ARM EXTEND key and at this time the arm will perform a short homing sequence. The speed of the arm during homing is a set value and cannot be changed. The value is entered by the CPU and is the encoder counts from rest (proximity switch) to check (proximity switch) position.

2. NOT USED

3. NOT USED

4. Lube "C" Dwell Position Set. During an Auto Cycle this function will turn on the lube output

These LED's will give a visual indication that an interlock is present. These indicators are:

RECIPROCATOR APPROACH

RECIPROCATOR START

RECIPROCATOR RESET

O.K. TO EXTEND

CYCLE STATUS Indicators:

These LED's will show the condition of the machine while in the auto mode. These indicators are:

READY

IN CYCLE

CYCLE COMPLETE

SHORT CYCLE

MACHINE STATUS Indicators:

These LEDS will show the condition of machine devices. This will assist in troubleshooting if there is a fault condition or devices need checked. These indicators are:

REST POSITION

APPROACH POSITION

IN DIE

FAULT

MACHINE POSITIONS

APPROACH POSITION:

This is a position above the top of the dies that the reciprocator can move to as the dies are opening and the part is being removed. Care must be taken in setting this position so as not to move the arm into any core pull cylinders on the top of the dies. **Note:** The O.K. TO EXTEND interlock is not needed to move to this position, unless the safe extend option is active (see explanation of AUX 4-4).

SPRAY POSITION 1 through 20:

These positions are the places at which the reciprocator can do one or all of the following functions:

1. Stop and spray. (Dwell times)
2. Change spray functions:
   a. Change the lube it is spraying.
   b. Turn another lube on.
   c. Turn a lube off.
   d. Turn on the blow air.
3. Change the speed at which the arm is moving.
4. Change the direction of travel.
5. Activate a wait function

The changes listed above can be done before the stop (if dwell time is used), or after the stop (as it begins to move again).

SPEEDS

POSITION 1 TO 2 through 19 TO 20:

This is the speed the arm will travel during an Auto cycle from one SPRAY POSITION to another. Range = 01% to 99%.

FAST SPEED:

The speed the arm will travel during an Auto cycle from the APPROACH POSITION to SPRAY POSITION 1 and from the last programmed spray position to REST. This speed is also used for the Manual cycle when the FAST key is pressed with another arm operation key. Range = SLOW SPEED to 99%.

SLOW SPEED:

The speed the arm will travel during an Auto Cycle from the REST POSITION to the APPROACH POSITION. This speed is also used for the Manual Cycle when the EXTEND or RETRACT key is pressed.

Range = 01% to 25% but must be less than FAST SPEED.

DWELL TIMES

AT POSITION 1 to 20:

This time is the time the arm will stop at a certain SPRAY POSITION. (Stop and Spray) Range = 0.0 to 99 seconds.

SPRAY FUNCTIONS

AIR DWELL-SET TIME:

During an Auto Cycle this function will turn on the air output solenoid during a DWELL TIME at a given SPRAY POSITION. The air solenoid output is output #2 and uses wire numbers 704 & L2.

LUBE B DWELL-SET TIME (Two Lube only):

During an Auto Cycle this function will turn on the LUBE B output solenoid during a DWELL TIME at a given SPRAY POSITION. The LUBE B solenoid output is output #3 and uses wire numbers 706 & L2.

After the dwell timer times out the purge timer is activated, this cleans the spray nozzles of excess lube (see AUX 2 parameters). The purge function leaves the spray air "B" solenoids activated for the purge time. The spray air "B" solenoid is output number 5 and uses wire numbers 719 & L2.

LUBE DWELL-SET TIME (lube A):

During an Auto Cycle this function will turn on the lube output solenoid during a DWELL TIME at a given SPRAY POSITION. The lube solenoid output is output #4 and uses wire numbers 705 & L2.

After the dwell timer times out the purge timer is activated, this cleans the spray nozzles of excess lube (see AUX 2 parameters). The purge function leaves the spray air "A" solenoids activated for the purge time. The spray air "A" solenoid is output number 6 and uses wire numbers 718 & L2.

AIR SWEEP-SET SPEED:

During an Auto Cycle this function will turn on the air output solenoid during a SWEEP from one SPRAY POSITION to the next. The air solenoid output is output #2 and uses wire numbers 704 & L2.

LUBE B SWEEP-SET SPEED (Two Lube only):

During an Auto Cycle this function will turn on the LUBE B output solenoid during a SWEEP from one SPRAY POSITION to the next. The LUBE B solenoid output is output #3 and uses wire numbers 706 & L2.

After the sweep is completed, the purge timer is activated, this cleans the spray nozzles of excess lube (see AUX 2 parameters). The purge function leaves the spray air "B" solenoid activated for the purge time. The spray air "B" solenoid is output #5 and uses wire numbers 719 & L2.

LUBE SWEEP-SPEED SET (lube A):

During an Auto Cycle this function will turn on the lube output solenoid during a SWEEP from one SPRAY POSITION to the next. The lube solenoid output is output #4 and uses wire numbers 705 & L2.

After the sweep is completed, the purge timer is activated, this cleans the spray nozzles of excess lube (see AUX 2 parameters). The purge function leaves the spray air "A" solenoid activated for the purge time. The spray air "A" solenoid is output #6 and uses wire numbers 718 & L2.

WAIT 1 FUNCTION (OPTIONAL):

During an auto cycle this function will turn on the wait 1 output #7 at a given spray position. This function, if programmed, will become active after a dwell and before a sweep. The reciprocator will wait at the spray position until it receives an CONTINUE FROM WAIT 1 (input # 15) from the DCM. A wait can be programmed at all 20 positions

WAIT 2 - 4 FUNCTIONS (OPTIONAL):

The reciprocator can have up to 3 additional (for a total of 4) programmable wait outputs and inputs. These are functionally identical to the original wait function except the teaching of these functions must be enabled. See AUX 4.4, Set Cycle Options, for enabling instructions. If two or more waits are programmed for a spray position, then all associated continue from wait inputs must be on for the reciprocator to continue the cycle.

WAIT WITH SPRAY FUNCTION:

The reciprocator wait functions usually wait after spraying at a dwell position. This option allows the reciprocator to spray while waiting. If set, the wait outputs will come on at the start of a spray dwell. The dwell time programmed will be counted down and when it reaches zero the programmed continue from wait input(s) will be checked. If the input(s) are not on, then spraying will continue until they do come on. Once the wait inputs do come on after the dwell time expires, the reciprocator will continue the cycle. The ability to teach this parameter must be enabled on key pad systems. See AUX 4.4, Set Cycle Options, for Enabling Instructions.

ARM POSITIONS

APPROACH POSITION:

This is a position above the top of the dies that the reciprocator can move to as the dies are opening and the part is being removed. Care must be taken in setting this position so as not to move the arm into any core pull cylinders or other obstructions on the top of the dies. **Note:** The O.K. TO EXTEND interlock is not needed to move to this position, unless the safe extend option is active (see explanation of AUX 4-4).

REST POSITION:

In this position the arm is fully retracted and the REST POSITION limit switch (701-PS) will be tripped. When this limit switch is tripped the REST POSITION LED on the control panel lights and the Input #12 is on. This is the only position of the arm that will allow the Auto Mode to be entered.

IN DIE:

When the arm is advanced past the APPROACH POSITION the IN DIE LED on the control panel lights indicating the arm is in the die.

CHECK POSITION:

This position is used by the computer to check the arm position during an Auto cycle. It uses a factory set proximity switch (702-PS) that activates Input #13. If it is necessary to reset this position see AUX 3 key explanation in this manual. Because the CHECK POSITION is checked on each cycle it must be adjusted so it is tripped on each cycle.

The function of the Check Position is to insure the spray manifold is repeating the same spray positions from cycle to cycle.

3.4 TEST PROGRAM (ONE LUBE):

NOTE: This test is for keypad versions, the video version is similar. The program below will allow the 410 Reciprocator to spray the following sequence:

1. Move to a position above the parting line.
2. Move down to position 1, turn on the Lube and Dwell there for 1.0 sec. (Stop and Spray)
3. Sweep down to position 2 at 35% full speed with Lube on. (Sweep & Spray)
4. Dwell at position 2 for 1.0 sec. with Lube on. (Stop & Spray)
5. Sweep down to position 3 at 15% full speed with Lube on. (Sweep & Spray)
6. Dwell at position 3 for 1.0 sec. with Lube on. (Stop & Spray)
7. Sweep down to position 4 at 45% with Lube on. (Sweep & Spray)
8. Dwell at position 4 for 1.0 sec. with Lube on. (Stop & Spray)
9. Sweep up to position 5 at 45% full speed with Lube and Air on. (Sweep & Spray)
10. Sweep up to position 6 at 45% full speed with Lube on. (Sweep & Spray)
11. Dwell at position 6 for 1.0 sec. with Lube on. (Stop & Spray)
12. Wait at position 6 until input from DCM is turned on.
13. Sweep up to position 7 at 25% full speed with Air on, turn off air at position 7 and continue out of die space. (Sweep & Blow)

POSITION SET SECTION:

1. Activate the machine by pressing the MANUAL key.

2. At this point if the MANUAL/ON LED is flashing the machine will have to be homed. If this is the case, see Homing Sequence in Section 2, if not continue on with #3.

The machine is now ready to program

NOTE: Homing the machine must be executed each time power is applied to the control panel. If power has not been removed it is not necessary to home the machine before programming or changing any values.

3. Press TEACH key.
4. Press POSITION SET key, the APPROACH POSITION LED will light.
5. Move the arm using the EXTEND key to the desired position for the approach position. This position should move the arm to a position just above the top surface of the dies.

NOTE: On dies having core pull cylinders on the top of the dies, care must be taken not to move into them or other obstructions.

6. Press ENTER key. This enters this position into the memory.
7. Press the POSITION SET key until the SPRAY POSITION 1 LED lights and 01 appears in the function numeric display.
8. Using the EXTEND key, move the arm until it reaches the approximate first spray position desired.
9. Press ENTER key, This enters SPRAY POSITION 1.
10. Press the POSITION SET key until the SPRAY POSITION 2 LED lights and 02 appears in the function numeric display.
11. Using the EXTEND key, move the arm until it reaches the approximate second spray position desired.
12. Press ENTER key. This enters SPRAY POSITION 2.
13. Press the POSITION SET key until the SPRAY POSITION 3 LED is lights and 03 appears in the function numeric display.
14. Using the EXTEND key, move the arm until it reaches the approximate third spray position desired.
15. Press the ENTER key. This enters SPRAY POSITION 3.
16. Press the POSITION SET key until the SPRAY POSITION 4 LED lights and 04 appears in the function numeric display.
17. Using the EXTEND key, move the arm until it reaches the approximate fourth spray position desired.
18. Press the ENTER key. This enters SPRAY POSITION 4.
19. Press the POSITION SET key until the SPRAY POSITION 5 LED lights and 05 appears in the function numeric display.
20. Using the RETRACT key, move the arm until it reaches the approximate fifth spray position desired.
21. Press the ENTER key. This enters SPRAY POSITION 5.
22. Press the ADD 5 key. This enables you to access positions 6 through 10.
23. Press the POSITION SET key until the SPRAY POSITION 1 LED lights and 06 appears in the function numeric display.
24. Using the retract key, move the arm until it reaches the approximate sixth spray position.
25. Press the ENTER key. This enters SPRAY POSITION 6
26. Press the POSITION SET key until the SPRAY POSITION 2 LED lights and 07 appears in the function numeric display.
27. Using the retract key, move the arm until it reaches the top of the die cavity. This will allow you to use the Air Sweep "Air Blow Off" on the way out of the die.
28. Press the ENTER key. This enters SPRAY POSITION 7.

THIS COMPLETES THE POSITION SETTING PORTION OF PROGRAMMING THE 410 RECIPROCATOR.

SPEED SET SECTION: (Sweep Speeds)

1. Press SPEED SET key until the LED beside POSITION 1 TO 2 lights.
2. Enter 35 (using keypad), 35 should now be displayed in the digital display to the left of the speed set key. The value of 35 tells the machine to run at 35% of full speed.
3. Press ENTER key, the sweep speed for POSITION 1 TO 2 has now been set.
4. Press SPEED SET key so the LED beside POSITION 2 TO 3 lights.
5. Enter 15 (using keypad).
6. Press ENTER key, the sweep speed for POSITION 2 TO 3 has now been set at 15%.
7. Press SPEED SET key so the LED beside POSITION 3 TO 4 lights.
8. Enter 45 (using keypad).
9. Press ENTER key, the sweep speed for POSITION 3 TO 4 has now been set at 45%.
10. Press SPEED SET key so the LED beside POSITION 4 TO 5 lights.
11. Enter 45 (using keypad).
12. Press ENTER key, the sweep speed for POSITION 4 TO 5 has now been set at 45%.
13. Press SPEED SET key so the LED beside POSITION 5 TO 6 lights.
14. Enter 45 (using keypad).
15. Press ENTER key, the sweep speed for POSITION 5 TO 6 has now been set at 45%.
16. Press SPEED SET key so the LED beside FAST SPEED lights.
17. Enter 45 (using keypad).
18. Press ENTER key, the FAST SPEED has now been set at 45%.
19. Press SPEED SET key so the LED beside SLOW SPEED lights.
20. Enter 10 (using keypad).
21. Press ENTER key, the SLOW SPEED has now been set at 10%.
22. Press ADD 5 key. This gives you access to speeds up to position 11.
23. Press SPEED SET key so the LED beside POSITION 1 TO 2 lights and the positions 06, 07 are displayed in the top two numeric displays.
24. Enter 25 (using keypad).
25. Press ENTER key, the sweep speed for POSITION 6 TO 7 has now been set at 25%. This is the blow off speed.

THIS COMPLETES THE SPEED SET SECTION OF PROGRAMMING THE 410 RECIPROCATOR.

TIME SET SECTION: (Dwell Times)

1. Press TIME SET key until the LED beside AT POSITION 1 lights.
2. Enter 1.0 (using keypad).
3. Press ENTER key, this will enter a 1.0 sec the dwell time AT POSITION 1.
4. Press TIME SET key until the LED beside AT POSITION 2 lights.
5. Enter 1.0 (using keypad).
6. Press ENTER key, this will set the dwell time AT POSITION 2 to 1.0 sec.
7. Press TIME SET key until the LED beside AT POSITION 3 lights.
8. Enter 1.0 (using keypad).
9. Press ENTER key, this will set the dwell time AT POSITION 3 to 1.0 sec.
10. Press TIME SET key until the LED beside AT POSITION 4 lights.
11. Enter 1.0 (using keypad).
12. Press ENTER key, this will set the dwell time AT POSITION 4 to 1.0 sec.
13. Press TIME SET key until the LED beside AT POSITION 5 lights.
14. Enter 1.0 (using keypad).

15. Press ENTER key, this will set the dwell time AT POSITION 5 to 1.0 sec.

16. Press ADD 5 key. This gives you access to timers from positions 6 through 10.

17. Press TIME SET key until the LED beside AT POSITION 1 lights.

18. Enter 1.0 (using keypad).

19. Press ENTER key, this will set the dwell time AT POSITION 6 to 1.0 sec.

THIS COMPLETES THE TIME SET SECTION OF PROGRAMMING THE 410 RECIPROCATOR

SPRAY SET SECTION: (Spray Functions)

1. Press SPRAY SET key until the LED beside the LUBE DWELL- SET TIME lights.
2. Enter 1 (using keypad) for SPRAY POSITION 1. The absolute position number (1 through 20) will be displayed in the Spray Functions digital display. The LED FUNCTION ON or FUNCTION OFF will be lit to indicate status of spray function at a given position. Entering a 2 from the keypad will display the status (on or off) of the function at position 2. If the function selected is a DWELL, the AT POSITION 2 LED will blink. If a SWEEP is the selected function, the SPEED POSITION 2 TO 3 LED will blink and likewise for a wait function the POSITION 2 LED will blink.
3. Press ON (using keypad). Notice FUNCTION ON LED is lit.
4. Press ENTER key, this will turn on LUBE DWELL AT POSITION 1.
5. Enter 2 (using keypad).
6. Press ON (using keypad). Notice FUNCTION ON LED is lit.
7. Press ENTER key, this will turn on LUBE DWELL AT POSITION 2.
8. Enter 3 (using keypad).
9. Press ON (using keypad). Notice FUNCTION ON LED is lit.
10. Press ENTER key, this will turn on LUBE DWELL AT POSITION 3.
11. Enter 4 (using keypad).
12. Press ON (using keypad). Notice FUNCTION ON LED is lit.
13. Press ENTER key, this will turn on LUBE DWELL AT POSITION 4.
14. Enter 5 (using keypad).
15. Press ON (using keypad). Notice FUNCTION ON LED is lit.
16. Press ENTER key, this will turn on LUBE DWELL AT POSITION 5.
17. Press ADD 5 key. This gives you access to spray functions for positions 6 through 10.
18. Press SPRAY SET key until the LED beside the LUBE DWELL-SET TIME lights.
19. Enter 1 (using keypad).
20. Press ON (using keypad). Notice FUNCTION ON LED is lit.
21. Press ENTER key, this will turn on LUBE DWELL AT POSITION 6
22. Press SPRAY SET key until LED beside AIR SWEEP-SPEED SET lights.
23. Enter 1 (using keypad).
24. Press ON (using keypad). Notice FUNCTION ON LED is lit.
25. Press ENTER key, this will turn on the AIR SWEEP from Position 6 to 7. This will give air blow off on the way out of the die.
26. Press SPRAY SET key until LED beside WAIT lights.
27. Enter 1 (using keypad).
28. Press ON (using keypad). Notice FUNCTION ON LED is lit.

THIS COMPLETES THE SPRAY FUNCTION SECTION OF PROGRAMMING THE 410 RECIPROCATOR

NOTE: While in teach, there is a "HANDS OFF" feature that will return the system to the

MANUAL or AUTO mode if there has not been any key strokes for 60 seconds.

3.5 AUTO TEACH:

AUTO TEACH function will also change the program. Enter AUTO TEACH while in Auto mode, by pressing the TEACH key. The Teach LED will flash. If no key is pressed for 60 seconds the system will return to the Auto mode. Pressing the manual key will also terminate teach and auto mode.

The use of the AUTO TEACH function will not interrupt the cycle of the machine. While in teach, the auto cycle messages will be overridden by the teach messages. Once you drop out of teach the auto cycle messages will return.

After pressing the teach key, any set key can be used to enter any area. If no values have been changed within 60 seconds the system will return to the Auto mode, retaining all present values.

Once a value has been selected it can be changed by using the up arrow or down arrow keys. Pressing the up arrow key will increase the value by 1 digit. If the up arrow key is pressed and held it will continue to increase the value at the rate of 1 digit every 1/10 second. The same holds true for the down arrow except it decreases the value. Spray Functions may also be changed by using the same arrow keys up arrow for "on" and down arrow for "off". If a wrong key is pressed you may clear the display by pressing the clear key. This will return the display to the original value.

After the desired value is changed, press the ENTER key. The display will blank for 1/2 second then return, indicating the new value has been entered.

The changed values will be stored and executed on the next cycle. You may exit the AUTO TEACH mode by pressing the TEACH key again or by not pressing any key for 60 seconds.

If the manual key is pressed, then both teach and auto mode will be terminated.

3.6 AUXILIARY KEY DEFAULTS

When the 410 reciprocator is shipped from the factory it has zero's in all of its parameters. This means that before the reciprocator can be used in an Auto cycle it must be programmed for the die in the machine (see programming section).

The following is a list of AUX key default values set at RIMROCK. These values are used for testing and will not work in a normal die cast program.

KEY NO.	DESCRIPTION	DEFAULT
AUX 1	1 MINIMUM SPEED (310 ONLY)	15
	2 CUSHION SPEED (310 ONLY)	15
AUX 2	1 LUBE A PURGE TIME	0.0
	2 LUBE B PURGE TIME	0.0

4. COMPONENTS

4.1 ELECTRICAL - GENERAL

The reciprocator electrical system components each run off one of the power sources available in the control cabinet.

Referring to the schematic, the primary power source is the 120 VAC power supplied by the customer. This powers the interlocks, the cycle complete relay (702 CR) and feeds the transformers primary side.

The 120 VAC supply also powers the power supply. The power supply is a 5, 12 and 24 VDC regulated supply. The 5 volt and 12 volt supply power the card cage and keypad. The 24V supply powers the proximity switches.

The I/O rack, located on the top of the control module, is the means by which the various components (operating at one of the voltage levels) are interconnected. The modules on the I/O rack are the basis of the inter-connections. For instance, when an interlock is made it will send its 120V signal to its corresponding yellow module and light up the LED next to it to show the signal was received. The circuit boards in the card cage, specifically the Digital I/O, receive a low voltage DC signal from the I/O rack telling it the module is "on". The same is true of the limit switches which turn on their corresponding white modules. The CPU can, in turn, send signals back by turning on various black and red modules. The function of each module is shown on the schematic.

4.2 ELECTRICAL - SPECIFIC

****

Whenever a board is removed from or inserted into the card cage, the power must be off. Failure to do this may damage the boards.

****

CENTRAL PROCESSING UNIT (CPU BOARD):

The CPU is the brain of the reciprocator, it contains the software and interfaces the other boards. The software is contained on the FLASH EPROM chip and the current values of the programmable parameters are held on the battery backed ram chip. Refer to the CPU drawing for the detail of this board. This board connects to the keypad and message center from its front edge.

The digital I/O can be part of the CPU or separate and is responsible for receiving the input signals from and sending the output signals to the I/O rack. This board has a ribbon cable running between it and the I/O rack.

P/N: see detail assembly drawings for part number.

SERVO BOARD:

The Servo board powers and receives feedback from the encoder, controls the signals that drive the arm, thus keeping track of and controlling the arm's position. It is connected to the computer, to the servo drive and to the encoder.

P/N: see detail assembly drawings for part number.

I/O RACK:

The I/O rack interfaces the various input and output signals between the card cage, the reciprocator and the D.C.M. Each module on the I/O rack has a fuse and LED that correspond with it. A fuse is located to the bottom right of each module and the LED is directly to the left of the module.

The LED's indicate when the module is "on". It is possible for the LED to be on if the fuse is blown, so if a function corresponding to a certain module is not working but the LED lights, check the fuse. P/N: 7622-201

I/O MODULE P/N:

120 VAC INPUT: 7622-402 (yellow)

4. COMPONENTS

4.1 ELECTRICAL - GENERAL

The reciprocator electrical system components each run off one of the power sources available in the control cabinet.

Referring to the schematic, the primary power source is the 120 VAC power supplied by the customer. This powers the interlocks, the cycle complete relay (702 CR) and feeds the transformers primary side.

The 120 VAC supply also powers the power supply. The power supply is a 5, 12 and 24 VDC regulated supply. The 5 volt and 12 volt supply power the card cage and keypad. The 24V supply powers the proximity switches.

The I/O rack, located on the top of the control module, is the means by which the various components (operating at one of the voltage levels) are interconnected. The modules on the I/O rack are the basis of the inter-connections. For instance, when an interlock is made it will send its 120V signal to its corresponding yellow module and light up the LED next to it to show the signal was received. The circuit boards in the card cage, specifically the Digital I/O, receive a low voltage DC signal from the I/O rack telling it the module is "on". The same is true of the limit switches which turn on their corresponding white modules. The CPU can, in turn, send signals back by turning on various black and red modules. The function of each module is shown on the schematic.

4.2 ELECTRICAL - SPECIFIC

****

Whenever a board is removed from or inserted into the card cage, the power must be off. Failure to do this may damage the boards.

****

CENTRAL PROCESSING UNIT (CPU BOARD):

The CPU is the brain of the reciprocator, it contains the software and interfaces the other boards. The software is contained on the FLASH EPROM chip and the current values of the programmable parameters are held on the battery backed ram chip. Refer to the CPU drawing for the detail of this board. This board connects to the keypad and message center from its front edge.

The digital I/O can be part of the CPU or separate and is responsible for receiving the input signals from and sending the output signals to the I/O rack. This board has a ribbon cable running between it and the I/O rack.

P/N: see detail assembly drawings for part number.

SERVO BOARD:

The Servo board powers and receives feedback from the encoder, controls the signals that drive the arm, thus keeping track of and controlling the arm's position. It is connected to the computer, to the servo drive and to the encoder.

P/N: see detail assembly drawings for part number.

I/O RACK:

The I/O rack interfaces the various input and output signals between the card cage, the reciprocator and the D.C.M. Each module on the I/O rack has a fuse and LED that correspond with it. A fuse is located to the bottom right of each module and the LED is directly to the left of the module.

The LED's indicate when the module is "on". It is possible for the LED to be on if the fuse is blown, so if a function corresponding to a certain module is not working but the LED lights, check the fuse. P/N: 7622-201

I/O MODULE P/N:

120 VAC INPUT: 7622-402 (yellow)

120 VAC OUTPUT: 7622-403 (black)

24 VDC INPUT: 7622-404 (white)

24 VDC OUTPUT: 7622-405 (red)

CARD CAGE:

The card cage houses the boards referred to above. The boards may be placed in any of the slots in the cage and in any order (RIMROCK has spelled out positions on drawings for convenience only). The card cage, and thus the boards, receive their power from the connector on the bottom of the cage. These boards are very voltage sensitive so the voltage going into the card cage must be held at 5.20 to 5.25 VDC. Refer to the 5V power supply section for adjusting this voltage. Be sure the power is off when inserting or removing the boards from the card cage.

DOOR SWITCH:

The door switch is in series with the control power. The reciprocator will not go into MANUAL or AUTO mode until the door switch is either pressed in by the cabinet door or pulled out when the door is open. Its intermediate position is open.

CONTROL POWER RELAY (701 CR):

This relay is the control power relay and is activated by the output module in slot 0 on the I/O rack. It goes closed when the MANUAL/ON key is pressed.

SERVO MOTOR CONTROLLER:

The motor controller takes the analog signals from the servo board in the card cage (through wires 45 & 46) and converts it into the appropriate speeds and motor directions. The motor controller table on the schematic shows the wiring of the servo drive and the motor controller. The control box wiring diagram, shows the motor controller pots and dip switch settings. The settings for these pots are also shown on this drawing and are shown at their correct positions.

The servo motor controller used in the RIMROCK 410 Servo Drive Reciprocator is an Advanced Motion Controls B25A-AC, (B25A40 for 80") series Pulse Wave Modulated servo amplifier. It has a red/green LED on the top, when the LED is red the drive is powered, but not enabled. When the LED is green the drive is powered and enabled. Enabled indicates that the motor can move if given a command. This controller has four user potentiometers which are described below.

****

WARNING: Hazardous voltages are exposed during the set up and operation of the motor control unit. **Exercise extreme caution-ONLY** qualified personnel should perform adjustments to the motor control unit.

****

Potentiometer 1 - Loop Gain

This control sets the voltage to current scaling factor. Turning it clock-wise increases the loop gain. ***The unit is shipped with Potentiometer 1 in the full CCW position and it is recommended that it not be changed.***

Potentiometer 2 - Current Limit

This control limits the motor's top end torque (current). It adjusts both continuous and peak current limit maintaining selected ratio. Turning it clock-wise increases the current limit. ***The unit is shipped with Potentiometer 2 in the full CW position and it is recommended that it not be changed.***

Potentiometer 3 - Reference Gain

This control adjusts the ratio between the input signal and the output variables (voltage, current, velocity). Turning it clock-wise increases the reference gain. ***The unit is shipped with Potentiometer 3 in the full CW position and it is recommended that it not be changed.***

Potentiometer 4 - Offset / Test

This control adjusts the imbalance in the input signal or in the amplifier (servo motor controller). ***The unit is shipped with Potentiometer 4 in the middle of its adjustment and it is recommended that it not be changed.***

Wires 703 and L2 feed in the power to the servo motor controller.

P/N: 06664-51

ENCODER:

The encoder is an optical device which tracks the arm. It works by shining a light through a disk which rotates with the arm. The disk has fine etches in it around its circumference where the light shines through. These etches in turn cause a series of pulses in the light as it shines through. The encoder then sends these pulses back to the servo card where they are counted, thus keeping track of the arm. The encoder is powered by and directly connected to the servo board in the card cage. Some models of encoders are susceptible to damage due to improper wiring so care must be taken when working with them. The encoder on the 410 SDR is part of the motor that drives the arm, and cannot be disassembled.

INTERCONNECT PCB:

The interconnect PCB (Rimrock Corporation P/N 140C11450-253) provides connectivity between the Servo Controller card,the servomotor encoder, the servomotor brake, and the servo amplifier. The servomotor encoder inputs plus over travel proximity switches (full extend and rest switches) are routed to the servo controller. The servo amplifier analog inputs and servo amplifier enable signals are routed from the servo controller. The failsafe brake signal from the servo controller is used to operate the solid state output module, which, in turn, operates the arm brake.

POWER SUPPLY:

This power supply feeds both the card cage and the keypad. The card cage requires a steady voltage input, so the power supply is regulated. The pot. which regulates it is located in the top of the supply and should be set for an output of 5.20 TO 5.25 VDC across wires 15 and 16.

KEYPAD:

The keypad is a combination of the keyboard and a circuit board mounted behind it. The keypad is hooked up directly to the CPU via a serial communications network in the card cage. A 13- pin connector is also located on the back of the keypad which is used to connect any remote switches. This connector may also be used to troubleshoot for any bad keys on the keypad (see the Troubleshooting section).

P/N: 11120-102 (Keypad)

P/N: 11120-109 (Back Display Board)

VIDEO KEYPAD:

As an option this machine is available with a Video Touch Screen Operator Interface, for use as a Keypad. This Video Interface utilizes a Capacitive Touch Screen on front of a Color LCD Flat Panel Display. All RIMROCK Machine in a cell can be controlled by this one interface. All functions are similar to utilizing a Standard Keypad. The only exceptions are in the teach area, where this device makes programming easier. This system is a combination of a Single Board Computer, LCD Color Flat Panel Display, Capacitive Touch Screen and Power Supply, all in one control box.

P/N: 11850-65 (Assembly)

PROXIMITY SWITCHES:

The reciprocator uses four proximity switches:

(1) Full Retract (rest position 701PS)

(2) Check Position PS (702PS)

(3) Reciprocator Clear PS (703PS)

(4) Reciprocator CW PS (706PS)

These are all normally open switches.

P/N:02863-20

5
Maintenance/ Troubleshooting

5. MAINTENANCE & TROUBLESHOOTING

5.1 MAINTENANCE

BEARING LUBRICATION:

The 410 Servo Drive Reciprocator is equipped bearings that are lubricated at assembly. This means there are grease fittings but no periodic lubrication is required.

GEAR BOX MAINTENANCE:

The gearbox used by the 410 reciprocator is a precision speed reducer. It is filled with grease by the manufacturer of the reducer. A grease change should be done every 10,000 hours or every 2 years. **2.5oz.** of new grease **(Shell Darina XL EP 2)** should be re-packed after removing the old grease and cleaning the internal parts. Before replacing the gearbox input half, the pilot counter-bore in the side plate should be cleaned making sure any gasket or foreign material is removed. The counter-bore should have silicon gasket material applied (Loctite Ultra Copper). Be careful that NO excess silicon goes into the gear box area as this will damage the reducer. Over greasing will also cause damage to the reducer.

5.2 TROUBLESHOOTING

The procedures in this section are intended as a reference for the experienced technician. It is strongly recommended that a digital multi-meter be used for all tests. Any meter used should have an input impedance of 20 megohms or higher.

Here is a list of the trouble codes which will appear in the upper right-hand LED window above the fault number display.

TROUBLE CODE	MEANING
0	NOT USED
1	ENCODER NOT COUNTING UP(310 ONLY)
2	ENCODER NOT COUNTING DOWN(310 ONLY)
3	NOT USED
4	NOT USED
5	NOT USED
6	NOT USED
7	701-CR SHORTED OR JUMPED OUT
8	NOT USED
9	NOT USED
10	NOT USED
11	FULL RETRACT SWITCH ON EARLY(410 ONLY)
12	FULL EXTEND SWITCH CAME ON(410 ONLY)
13	SERVO SYSTEM FAULTED(410 ONLY)

5.2.1 RECIPROCATOR FAULT LIST

In most cases faults can be cleared by pressing the Clear key. The explanation of faults below will indicate the reason for the fault, and in many cases give the correction for the fault.

COMMUNICATION FAULTS
8.91 FAULT- NOT USED
8.92 FAULT- TOO MANY BAD CHECKSUMS (COM1)
8.93 FAULT- TOO MANY CONSECUTIVE RETRIES (COM1)
8.94 FAULT- UNRECOGNIZED COMMAND FROM KEYPAD (COM1)
8.95 FAULT- KEYPAD NOT RESPONDING (COM1 or COM2)
8.96 FAULT- NOT USED
8.97 FAULT- TOO MANY BAD CHECKSUMS (COM2)
8.98 FAULT- TOO MANY CONSECUTIVE RETRIES (COM2)
8.99 FAULT- UNRECOGNIZED COMMAND FROM KEYPAD (COM2)

OPERATIONAL FAULTS
9.00 FAULT- CHECK CONTROL POWER SENSE INPUT
9.01 FAULT- CHECK POSITION ERROR ARM IS OUT OF POSITION
9.02 FAULT- CHECK POSITION NOT SET CORRECTLY
9.03 FAULT- LOST DCM IN AUTO SIGNAL
9.04 FAULT- PROGRAM ERROR
9.05 FAULT- O.K. TO EXTEND LOST (DCM CLEAR SIGNAL)
9.06 FAULT- DIE LOCKED RECEIVED BEFORE CYCLE COMPLETE
9.07 FAULT- ENCODER TRACKING FAULT
9.08 FAULT- NOT USED
9.09 FAULT- NOT USED
9.10 FAULT- NOT USED
9.11 FAULT- NOT USED

Pull E-Stop Button Out

5.2.2 COMM. FAULT CORRECTION

8.92 TOO MANY BAD CHECKSUMS - Check for loose connections on (COM1) serial cable or possible R.F. interference

8.93 TOO MANY CONSECUTIVE RETRIES Check for loose connections on (COM1) serial cable or possible R. F. interference.

8.94 UNRECOGNIZED COMMAND FROM KEYPAD Check for loose connections on (COM1) serial cable or possible R. F. interference.

8.95 KEYPAD NOT RESPONDING - Check serial cables and their connections (COM1 or COM2).

8.97 TOO MANY BAD CHECKSUMS - Check for loose connections on (COM2) serial cable or possible R.F. interference.

8.98 TOO MANY CONSECUTIVE RETRIES Check for loose connections on (COM2) serial cable or possible R. F. interference.

8.99 UNRECOGNIZED COMMAND FROM KEYPAD Check for loose connections on (COM2) serial cable or possible R. F. interference.

5.2.3 OPR. FAULT CORRECTION

9.00 CONTROL POWER – Power to the power sense circuit has been lost or is stuck on. If a trouble code of 7 is given then 701-CR is shorted or jumped out. If no trouble code then check the external safeties, door switch, and E-STOP buttons. If those are ok, reapply power by going to manual mode. If trouble code is 7 then circuit breaker 901-CB must be cycled before going to manual mode.

9.01 CHECK POSITION ERROR - Press Clear key, and check Encoder connections, re-teach the Check Position, and check 9.01 fault sensitivity setting. Also check the check position proximity switch for proper operation.

9.02 CHECK POSITION OUT OF RANGE- Press Clear key and reset Check position. It is not set correctly. See Check Position setting under AUX 3 in section 3.

9.03 Lost DCM in auto-press clear key and check status of Input 23.

9.04 PROGRAM Error-Check position proximity switch not activated during auto cycle or Spray Position, less than Approach Position. Modify program to trip check position proximity switch or reposition check position proximity switch. Modify Spray Position or Approach Position.

9.05 NOT O.K. TO EXTEND LOST Lost O.K. to Extend trying to Extend in Auto or Manual. If in Auto-Manually Retract arm out of die. If in Manual-release Extend key or activate O.K. to Extend interlock.

9.06 RESET BEFORE CYCLE COMPLETE- The reset interlock (die locked) is received before the arm reaches the Approach Position. Press the Clear key and check die cast machine cycle.

9.07 ENCODER TRACKING FAULT - Computer has lost track of arm during movement. This fault can also be generated by a proximity Switch that is activated out of sequence. Check the trouble code in the upper right display for additional information. Press the Clear key and check Encoder connections and Servo Motor Controller.

5.2.4 I/O DESCRIPTION

The simplest way to check a module is to switch it with one you know is good. If this corrects the problem replace the module.

Output functions I/O rack 1:

0 Turns on the control power (701-CR) provided the control box door is closed when the manual key is pressed.

1 Turns on cycle complete relay (702-CR) at the end of the Auto cycle. This will stay on until the reset signal is received from the die cast machine or power is removed from the box.

2 Output for Blow valve.

3 Output for Lube "B" pilot solenoid.

4 Output for Lube "A" pilot solenoid.

5 Output for Spray Air "B" solenoid.

6 Output for Spray Air "A" solenoid.

7 Turns on wait 1 relay (708-CR) when it is programmed in an auto spray cycle.

16 Turns on Reciprocator in Auto relay (706-CR) whenever the reciprocator is placed in auto mode.

17 Turns on Reciprocator Faulted relay (707-CR) when a fault occurs on the reciprocator. This will stay energized until the fault condition is cleared.

18 Output for Lube "C" pilot solenoid.

19 Output for Spray Air "C" solenoid.

21 Turns on Wait 2 relay (709-CR) when it is programmed in an auto spray cycle.

Input functions rack I/O 1:

8 Die cast machine interlock (Dies Full Open).

9 Die cast machine interlock (Die Start Open).

10 Die cast machine interlock (Reciprocator Start).

11 Die cast machine interlock (Die Locked).

12 Activated by proximity switch # 701-PS (Rest Position) when reciprocator is fully retracted.

13 Check position, activated by PS-702.

14 Control power sense.

15 Die cast machine interlock (Continue from Wait 1).

22 Die cast machine interlock (DCM in Auto).

23 Die cast machine interlock (Continue from Wait 2).

Output functions Interconnection PCB:

J4 (1,2) Module S1 Output for servomotor brake.

J1 (1,2) Servo controller analog output to servo amplifier.

J1 (3,4) Servo controller enable output to servo amplifier.

Input functions Interconnect PCB:

J4 (4,6) Servomotor (arm) full extend proximity switch.

J4 (5,6) Servomotor (arm) full retract (rest) proximity switch.

J4 (10,11) Servomotor encoder phase A differential inputs.

J4 (8,9) Servomotor encoder phase B differential inputs.

5.2.5 POWER SUPPLY:

As mentioned in the components section this power supply should have a reading of 5.20 to 5.25 VDC across wires 15 and 16. This is the voltage that gets fed into the card cage and keypad. This power supply also has a +/- 12 VDC and a 24 VDC output. The +/- 12 VDC is used for communications and the 24 VDC supply is used for limit switches. The incoming voltage to the power supply should be 120 VAC.

Voltage checking on power supply:

5 volt supply

Using a digital multi meter on 5 volts DC scale measure the voltage on wires # 15 & 16. This should read 5.20 to 5.25 VDC. If the voltage is low, disconnect the power connectors to the card cage and the keypad. Measure the voltage again, if the voltage is normal there is a short somewhere in the wiring, card cage or keypad. Use the elimination method to locate the problem.

12 volt supply

Using a digital multi meter on 20 volts DC scale measure the voltage on wires # 80, 81 & 82. The voltage between 80 and 81 should read 12.0 to 12.1 volts. The voltage between 80 and 82 should read -12.0 to -12.1 volts. If the voltage is low, disconnect the power connectors to the card cage and the keypad. Measure the voltage again, if the voltage is normal there is a short some where in the wiring, card cage or keypad. Use the elimination method to locate the problem.

24 volt supply

Set the DMM to 24 volt scale and measure the voltage across wires # 1 & 11, which should read 24 - 28 volts. If this voltage is low use the elimination method to locate the problem.

To check the isolation between the DC and AC portions of the supply, take readings from 15 to 9L1 and 9L2: the readings should be approximately 0-0.5 VDC. The same is true of wire 16 to 9L1, 9L2 and GND.

To check the DC ripple take readings from 15 and 16: the value should be less than 0.3 VAC.

****

WARNING: Hazardous voltages are exposed during the set up and operation of the motor control unit. **Exercise extreme caution-ONLY** qualified personnel should perform adjustments to the motor control unit.

****

5.2.6 ENCODERS:

One method of checking an encoder is to switch it with an encoder on another machine to see if the problem follows the encoder (remember the encoder on this machine is part

of the motor, so the motor will have to be changed).

Another check that may be made is to jog the arm while in teach mode with an appropriate parameter being displayed (i.e. the APPROACH POSITION parameter while jogging the arm forward). While jogging the arm periodically release the jog key and note the value displayed in the window each time. The value should increase/decrease in an expected manner. Most likely if this is not the case the machine will be experiencing 9.07 (following fault) faults.

5.2.7 CIRCUIT BOARDS:

The only method available for checking a circuit board is to replace it with one that is known to be good.

********** NOTICE **********
When it is necessary to remove a circuit board from the card cage, it is imperative that all power be removed from the control panel. This is also true when installing a circuit board in the card cage. Failure to due so will cause permanent damage to the circuit board.
****

5.2.8 KEYPAD:

If a key on the keypad does not respond, the problem may be that the key has worn out. The method for checking the keys is to first locate the 13-pin connector on the lower right hand portion of the PC board mounted to the back of the keypad. Next, remove this connector and refer to the chart below to find out which two pins correspond to the key in question: the pins are numbered from top to bottom. Next, take a voltmeter set to read ohms or continuity and put the leads on the pins and push the key; continuity should be made.

If the key being tested is the MANUAL/ON key, make sure that the door switch is not the cause of the problem. If the switch is in its center, or open position the reciprocator will not go into MANUAL mode.

Testing Keypad switches:

Using a digital Multi-meter on low ohms scale, the key pad can be checked using the following pin out chart. The pins referred to are located in the lower right hand corner next to the blue ribbon connector on the rear of the display circuit board. They are numbered from the top down . Using a low ohms scale with the leads on the desired pins, depressing the key you wish to test, you should see a "0" reading. This action tells you the key is functioning.

KEY	PIN #'s
manual / on	3,5
auto	2,5
auto cycle start	5,10
position set	3,4
spray set	2,4
speed set	4,10
timer set	4,11
teach	4,12
AUX 1	1,5
AUX 2	1,6
AUX 3	1,7

OUTPUT SPECIFICATIONS

Total Output Power	115W	
Output Voltage Centering	Output 1: ±1% Output 2: ±5% Output 3: ±5% Output 4: ±5%	(All outputs at 50% rated load)
Source Regulation	Outputs 1-4: 0.5%	
Load Regulation	Output 1: 1% (10-100% Load Change) Output 2: 5% (10-100% Load Change) Output 3: 5% (10-100% Load Change) Output 4: 5% (10-100% Load Change)	
Cross Regulation	Output 2: 5.0% Output 3: 5.0% Output 4: 5.0%	(Output 1 Load Varied 50-100%)
Output Voltage Adjust Span Resolution	 Output 1: 95% To 105% 1%	
Output Noise Source Freq. Switching Freq. Total (20MHz)	 Outputs 1-4: 0.5% Outputs 1-4: 1% Outputs 1-4: 1%	(Output under test at 100% rated load)
Hold Up Time	16mS Min, 115W Output 120V Input	
Start Up Time	1 Second	

INPUT SPECIFICATIONS

Source Voltage	85 - 264 Volts Continuous
Frequency Range	47-63 Hz
Source Current True RMS Peak Inrush	 3.5A at 85V Input 40A
Efficiency	.72-.80 (Varies by model)
Turn On Overshoot	None
Transient Response Voltage Deviation Recovery Time Load Change	Outputs 1-4 5% 2mS 50% To 100%
Output Overvoltage Protection (Optional)	Output 1: 110-150%
Output Overpower Protection	110% min., outputs 1-4, Outputs cycle on/off, auto recovery

ENVIRONMENTAL SPECIFICATIONS

Ambient Operating Temperature Range	0° C to +50° C
Storage Temperature Range	-40° C To +85° C
Temperature Coefficient	Outputs 1-4: 0.02%/°C
Shock	Transit drop per MIL-STD-810E Method 516.4 Procedure IV
Vibration	MIL-STD-810E, Method 514.4 Category 1
Conducted Emissions	EN 55022 Class B

GENERAL SPECIFICATIONS

Dielectric Strength	4242 VDC, Primary to Secondary, 1 Sec. 2121 VDC, Primary to Ground, 1 Sec. 500 VDC, Secondary to Ground, 1 Sec.
Power Fail Signal (Optional)	Logic low with input power failure, 2 mS minimum prior to output 1 dropping 1%
Mean-Time Between Failures	150,000 Hours min., MIL-HDBK-217F, 25° C, GB
Weight	2.25 Lbs. Chassis and cover 1.30 Lbs. Open frame

NOTES:

1. Consult factory for alternate output configurations.
2. Consult factory for positive, negative, or floating outputs.
3. Specify optional overvoltage protection, power fail signal, chassis or cover when ordering.
4. UL, CUL, only.
5. TUV only.

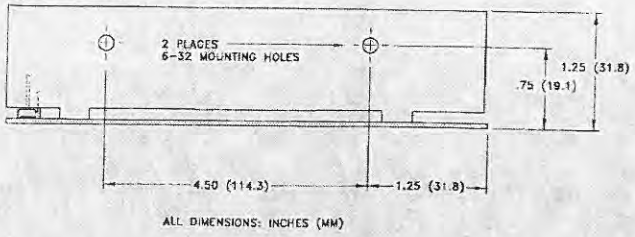
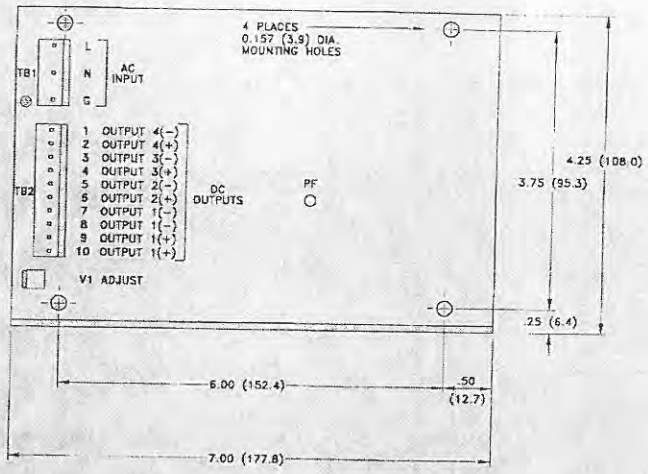
SRW 115 SERIES MECHANICAL INFORMATION

Open Frame



ALL DIMENSIONS: INCHES (MM)



AC Input and Ground Connector TB1:

- .156 inch friction lock header mates with Molex 09-50-3051 or equivalent crimp terminal housing with Molex 08-50-0189 or equivalent crimp terminal.

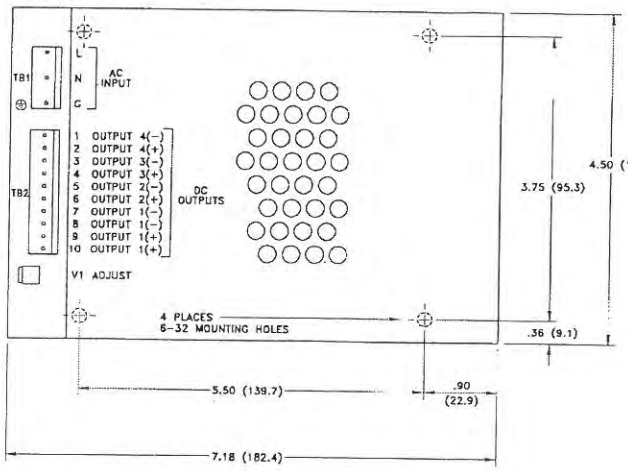
DC Output Connector TB2:

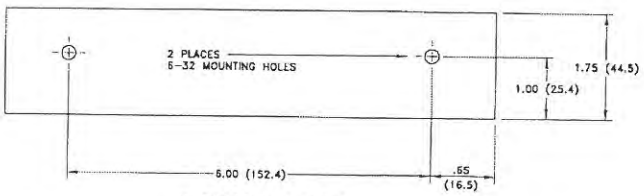
- .156 inch friction lock header mates with Molex 09-50-3101 or equivalent crimp terminal housing with Molex 08-50-0189 or equivalent crimp terminal.

Power Fail Connectors:

- PF: Power fail signal
- TB2-7,8: Power fail signal return

Optional Chassis & Cover





ALL DIMENSIONS: INCHES (MM)

APPLICATIONS INFORMATION

1. Maximum screw penetration into mounting holes is .25 inch.
2. Each output can deliver its rated load but total output power must not exceed 115 watts.
3. A minimum load of 20% is required on output one to insure proper regulation of remaining outputs.
4. Peak to peak output ripple and noise is measured directly at the output terminals of the power supply, without the use of the probe ground lead or retractable tip, 20 MHz bandwidth.
5. This power supply has been safety approved and final tested using a DC dielectric strength test. Please consult factory before performing an AC dielectric strength test.
6. This product is intended for use as a professionally installed component within information technology equipment.

INDEPENDENT AIR PILOTED AUTOMATIC SPRAY NOZZLE*

MODEL 026 Series

TYPICAL APPLICATIONS:
Die casting.....Die Release
Forging.....Die Lubrication

SPRAY PATTERNS AVAILABLE:
Flat fan or solid cone.

SPRAY DIRECTION:
Extended figure "8" type spray outlet adjustable thru 360°. No tools required.

LIQUID FLOW:
Independent control of each outlet adjustable by turning dial knobs.

LIQUID SHUTOFF:
Needle type sealing in replaceable Viton seat.

SIZE:
2¾" lg. x 2" high x 2¾" deep.

WEIGHT:
11 oz.

LIQUID INLET:
As supplied in manifold.

SPRAY ATOMIZING AIR INLET:
As supplied in manifold.

PILOT AIR INLET:
As supplied in manifold.

PILOT AIR PRESSURE:
Air-actuated piston shutoff requires 40 PSI minimum pressure controlled by remote 3-way valve.

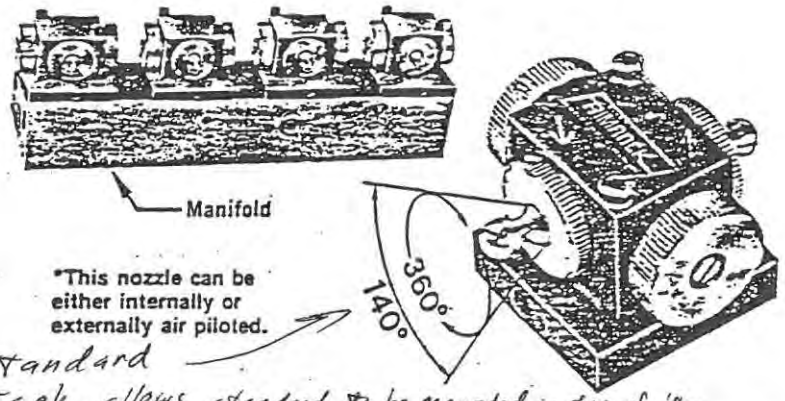
SPRAY ATOMIZING AIR PRESSURE:
Set pressure to achieve degree of atomizing desired, controlled by remote 3-way valve.

LIQUID PRESSURE:
Same as atomizing air pressure

MOUNTING:
Multiple nozzle mounted on manifold. For use on reciprocating type mechanisms for spraying opposing surfaces. Standoff mounting also available.

MATERIAL:
Aluminum, Brass, Polyurethane and Viton Seals.

This automatic nozzle is a double-headed improved version of the Model 016 nozzle. It is used for spraying opposing surfaces simultaneously and can be manifold-mounted, ideal for reciprocating mechanisms. It incorporates the unique Figure "8" type spray outlet that is adjustable through a 360° rotation and a 140° arc. This makes it very easy to direct the two sprays other than 180° from each other. Its self-contained, needle-type shutoff and lube metering assembly can be easily removed without tools when cleaning or repairing is required.



*This nozzle can be either internally or externally air piloted.

026 Standard
026 Stack, allows standard to be mounted on top of it
